

2010 Minnesota K-12 Academic Standards in English Language Arts: What Do Content Teachers Need to Know?

Frameworks for Mathematics and Science Standards Workshop
October 2011

2010 Minnesota Academic Standards-English Language Arts K-12

The standards are organized into three main sections

Standards for English Language Arts & Literacy in History/ Social Studies, Science and Technical Subjects GRADES K-5

Standards for English Language Arts GRADES 6-12 Standards for
Literacy in History/
Social Studies, Science
and Technical Subjects
GRADES 6-12

Each section is divided into strands

Reading Foundations Literature Informational Text	Reading Literature Informational Text	Reading
Writing	Writing	Writing
Speaking, Viewing, Listening & Media Literacy	Speaking, Viewing, Listening & Media Literacy	
Language	Language	

Each strand features learning progressions that are anchored in college and career readiness standards

Distribution of Literary and Informational Passages by Grade in the 2009 NAEP Reading Framework

Grade	Literary	Informational
4	50%	50%
8	45%	55%
12	30%	70%

Distribution of Communicative Purposes by Grade in the 2011 NAEP Writing Framework

Grade	To Persuade	To Explain	To Convey Experience
4	30%	35%	35%
8	35%	35%	30%
12	40%	40%	20%

Strands and substrands

Anchor standards and benchmarks

Grade level progressions

Definition of "text"

Where are these benchmarks taught and assessed?

Looking at the Standards

- Find a couple people who teach a similar grade/content area as you.
- Pick a section of the Literacy standards that applies to your group.
- 1. What are some practices that you are doing now that help students with those standards?
- 2. What modifications in your instruction could you make to more fully help students improve in those standards?
- 3. What actions could your school, department, or district take to support teaching and learning in these areas?

Your Ideas – Literacy Strategies

Reading & Science Correlation

Reading Strategy	Inquiry Science
Activating background knowledge	Observing
Questioning	Hypothesizing
Searching for information	Designing Experiments Collecting data
Summarizing	
Organizing graphically	Representing findings

Writing Example – Lab Report

Lab: Compare the Kinetic and Potential Energy for a golf ball going down ramps of varying heights

- 1. Write a hypothesis
- Make a data table including
 Mass of ball, Length of ramp, Times for 3 trials
 Ave. time, Ave. Speed, Final Speed, Final KE,
 Initial PE, initial PE final KE
- 3. Write the Conclusion

Criteria for a Conclusion

1.

The purpose of this lab was to determin how height affects Kinetic energy. If the height of the samp is higer, then the Kinetic energy of the ball will increase. The data of this lab supports the hypothesis. When the ramp was at . 08-m the "ball had a final Kinetic energy was .0231. When the rump was at a height of .49m the final Kinetic energy of the ball was . 1251. That proves that the buil has more Kinelic energy when it Polls down a ramp cet a higher height. There was many possible errors that Could have affected this lab. One possible error is that the timer may have not been Started or stoped at the romed time. Another error could have been that all the calculations could have been done incorrectly, giving bad results. Another possible from could be that the height of the ramp was measured incorrectly. In the flature it would be Attresting to use different Kinds of balls. One area that could have been inproved is how we divided the work load up.

Golf Ball Con Clusian Hypothesis-if the ramp is a lot steeper then the golf ball will roll faster - The hypothesis was correct. The Ligher the samp was the faster the ball was. It was a greater knetic energy. We had to use 3 books for the Keight. As we got more books from 1 to 3 the speed was greater every time. The table was big because of all the calculations. We had to find the velocity and Kinetic energy to calculate most or. the calculations. This was a pretty for lab to do with the timers and golf clubs even though it took a longer time.

Conclusion	Refets back to the hypothesis and answers	1 requirement not met.	Both requirements not met.	No conclusion.
	the problem question. Uses correct sufficiently and specific data to show that the	Data is not sufficient or specific.	Summary of data is incorrect.	No conclusion
l pt/	hypothesis was supported or rejected. Detailed and scientifically correct explanation for the	Explanation of results is not detailed.	Explanation of results is incorrect.	• No conclusion.
	experimental results. Identification of a significant source of experimental error and a detailed discussion on how this could have affected the results.	Identification of an insignificant source of experimental error or a weak discussion on its affects.	Source of error and/or its affects are incorrect.	• No conclusion
	Thorough explanation for how to prevent this	Explanation is lacking detail.	Explanation is incorrect.	No conclusion.
	error in the future. Detailed identification of a related and significant future research possibility.	Future research is related and significant but is lacking details.	Future research is unrelated or unclear.	No conclusion.

- The purpose of this activity was to discover how potential and kinetic energy are related. The hypothesis unique to our group was if the ball is at a higher height, then it will have more potential and kinetic energy.
- Our hypothesis was supported by the results of the experiment since every time we increased the heights the potential and kinetic energies also increased.
- 3) At the shortest height (0.75 m) the two energies were 0.0331 J and 0.000506 J, potential and kinetic respectively. Then when the ramp was moved up to 0.15 m the energies increased to 0.0662 J of potential energy and 0.00325 J of kinetic energy. The final and tallest height was 0.462 meters. At this height the potential energy was 0.204 J and the kinetic energy was 0.0151 J. All of these numbers show the trend of the higher the height the more the energy increases. In the end, the height increased 0.387 m, the potential energy increased 0.1709 J, and the kinetic energy increased 0.014594 J.
- Within this experiment there were multiple places where errors may have occurred. The first place for possible error would be the in the timing. When the ball was released and when it exited the ramp may not have been perfectly timed since it was a human timing it and every human has reaction times that need to be calculated in. Also every time the ball was released it may have slightly moved the ramp down altering the height. This could have happened since we did not check the height of the ramp before we released the ball and the ramp might have been bumped. The last error is during this experiment two different people released the golf ball this may have changed the results since we may have released the ball differently and manipulated the balls descent.
- 5) You could continue this type of study by doing a similar experiment at more drastic height differences. Also you could switch it up by using different items and seeing how mass and weight will change all of the energy calculations.

Related Science Benchmarks

Formulate a testable hypothesis, design and conduct an experiment to test the hypothesis, analyze the data, consider alternative explanations and draw conclusions supported by evidence from the investigation. 9.1.1.2.1

Communicate, justify and defend the procedures and results of a scientific inquiry or engineering design project using verbal, graphic, quantitative, virtual or written means. 9.1.3.3.1

Related Writing Standards

- 1. Write arguments to support claims in an analysis of substantive topics or texts using valid reasoning and relevant and sufficient evidence.
- 2. Write informative/explanatory texts to examine and convey complex ideas and information clearly and accurately through the effective selection, organization and analysis of content.
- 4. Produce clear and coherent writing in which the development, organization, and style are appropriate to task, purpose, and audience.
- 5. Use a writing process to develop and strengthen writing...

- 6. Use technology to produce and publish writing and to interact and collaborate with others.
- 7. Conduct short as well as more sustained research projects based on focused questions, demonstrating understanding of the subject under investigation.
- 9. Draw evidence from literary and informational texts to support analysis, reflection, and research.
- 10. Write routinely over extended time frames and shorter time frames for a range of tasks, purposes, and audiences.
